Kavita Shah, et al.

Application No.: 10/660,113

Page 2

AMENDMENT: IN THE SPECIFICATION

Please enter the Sequence Listing into the application.

1. Please replace the paragraph [0059] with the following amended paragraph:

[0001] Although the GTPases are employed in a variety of diverse functions, they are characterized by highly conserved sequence motifs (i.e., shared structural characteristics that define the genus) that encode the guanine nucleotide-binding domain (see, for example, Bourne et al. (1991) "The GTPase superfamily: conserved structure and molecular mechanism" Nature 349:117-27). For example, Table 1 illustrates a partial alignment of 9 exemplary GTPases showing amino acid subsequences which comprise part of the substrate binding site.

Table 1. Partial amino acid sequence alignment of exemplary GTPases.

GTPase	position	amino acid subsequence	position	amino acid subsequence
